# ON OPTIMAL RECOVERY OF PERIODIC ANALYTIC FUNCTIONS

K. Yu. Osipenko, Moscow, Russia

Let $S_\beta := \{z \in \mathbb{C} : |\operatorname{Im} z| < \beta\}$ be a strip in the complex plane. Denote by $H_p^\beta$ the class of $2\pi$-periodic, analytic in $S_\beta$ functions $f$, which satisfy

$$\sup_{0 \le \eta < \beta} \frac{1}{4\pi} \int_{\mathbb{T}} (|f(t+i\eta)|^p + |f(t-i\eta)|^p)\, dt \le 1, \quad 1 \le p < \infty,$$
$$\sup_{z \in S_\beta} |f(z)| \le 1, \quad p = \infty.$$

We consider the problem of optimal recovery of $Lf = f(\xi)$ or $f'(\xi)$, $\xi \in \mathbb{T}$, using the information $If = (f(x_1), \dots, f(x_n))$, $x_j \in \mathbb{T}$. We calculate the intrinsic error

$$e(L, H_p^\beta, I) := \inf_{A : \mathbb{C}^n \to \mathbb{C}} \sup_{f \in H_p^\beta} |Lf - A(If)| \tag{1}$$

and find an optimal algorithm $A^*$ for which the infimum in (1) is attained.

For example, if $Lf = f'(0)$ and $If = (f(-h), f(h))$, then an optimal algorithm is given by

$$f'(0) \approx \frac{K}{\pi} \operatorname{dn}^{\frac{2(p-1)}{p}} \frac{K}{\pi} h \; \frac{f(h) - f(-h)}{\operatorname{sn} \dfrac{2K}{\pi} h},$$

where $\operatorname{dn} z$ and $\operatorname{sn} z$ are the Jacobi elliptic functions with modulus $k$ defined by the equation

$$\frac{\pi K'}{2K} = \beta$$

($K$ and $K'$ are the complete elliptic integrals of the first kind with moduli $k$ and $k' = \sqrt{1-k^2}$).
